

06.02.2024.

As part of the project "Establishment of a system for the production of geothermal energy in the area of the City of Križevci", a contract for the performance of hydrodynamic tests on the geothermal well Križevčanka -1 was signed today.

This is an extremely important step, considering that this test will determine the characteristics of the deposit and define the parameters of the deposit necessary for the preparation of the Elaboration on Reserves, which is the key document on the basis of which the license for exploitation is obtained.

The contract was signed by the director of the company Crosco Ferenc Tarr as the contractor and the director of the Komunalno poduzeće d.o.o. Križevci Martin Kozjak as the holder of the well exploration permit.

The value of the signed contract is EUR 170,941.80 and was co-financed from the European Economic Area Financial Mechanism 2014-2021 – Program "Energy and Climate Change".

The final goal is to use the geothermal well Križevčanka -1 for heating a complex of public buildings that are near sources such as schools, university, potentially the city pool, but also to enable the use of geothermal energy for heating greenhouses and dryers in cooperation with the university, which near the well there has its agricultural areas and workshops.

Lead Beneficiary of the project "Establishment of a system for the production of geothermal energy in the area of the City of Križevci" is the City of Križevci, and the partners are the Komunalno poduzeće d.o.o. Križevci and Efla h.f.
